STRUCTURED FINANCE CASE

Clean power for a Greater Bangkok data centre

A proposed solar-and-storage financing structure aligning customer offtake, power delivery, construction and financing risk.

ILLUSTRATIVE A proposed structuring approach, not an executed deal. YD Advisory did not advise on a completed transaction. The case sets out how the firm would allocate risk and structure the financing. All charts show illustrative shapes, not forecast figures.

THE APPARENT PROBLEM

Raising capital. The proposition brings together a developer with clean-power assets, a data-centre customer seeking long-term renewable electricity and lenders assessing whether the project is fundable.

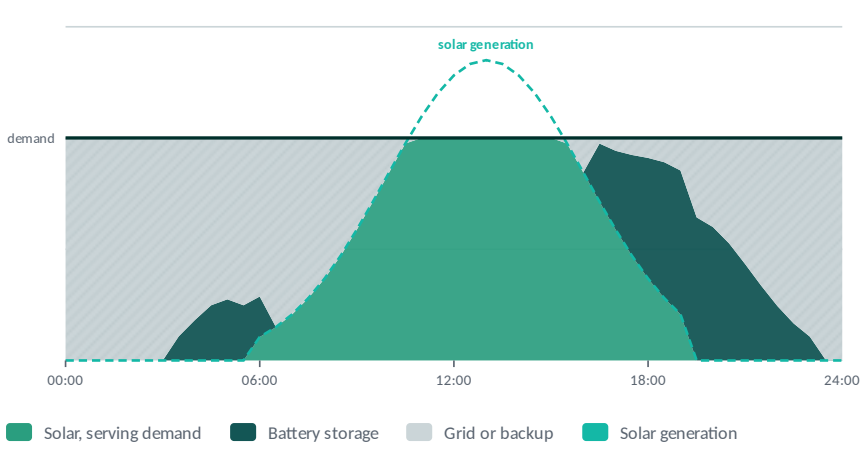

THE CORE ISSUE

Capital is not the first problem. The work is allocating delivery, construction, customer and financing risk so that each party holds only what it can bear and price.

1	1	4	24/7
RING-FENCED PROJECT COMPANY	ANCHOR PPA CUSTOMER	WORKSTREAMS TO ALIGN	LOAD PROFILE TO BE ADDRESSED

YD ADVISORY SCOPE. Transaction structuring, asset and pipeline valuation, an hourly generation and demand model, investor materials, capital raising and commercial negotiations. Thai legal, regulatory and technical advisers assess the delivery route, permits, grid access and engineering.

THE POWER COVER CHALLENGE

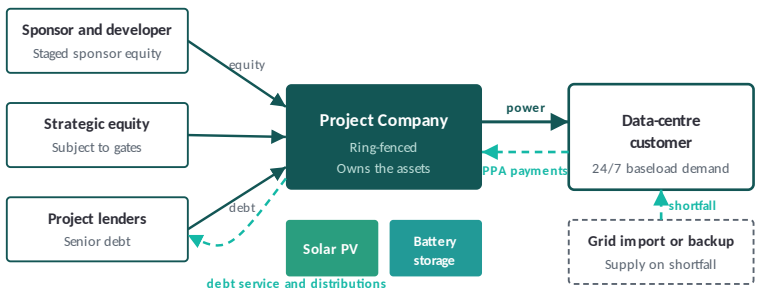

Solar covers the middle of the day
Generation peaks at midday and the surplus above demand charges the battery.

Storage carries the evening
The battery discharges as solar falls, extending cover into the evening peak.

Grid or backup covers the rest
Overnight demand and any residual gap are met from the grid or on-site backup, and that cost has to be allocated.

Illustrative daily load and generation shape for a continuous 24/7 data-centre load, not forecast output.

THE TRANSACTION STRUCTURE

Equity, debt and contracted power
Cash flows and shortfall supply

Contracted PPA revenue is applied through a waterfall. The project company owns the assets and isolates project risk from the developer, giving lenders defined security.

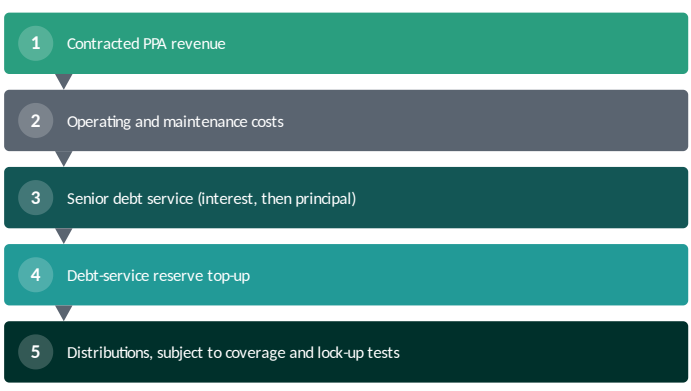

HOW RISK IS ALLOCATED

	Developer / EPC	Project Co	Customer	Senior Lenders	Grid / Market
PPA credit and volume		◖	●	◖	
Grid access and delivery	◖	◖			●
Construction and completion	●	◖		◖	
Power shortfall (volume and price)		◖	●		◖
Financing terms		◖		●	

● Holds the risk ◖ Shares

Each risk is assigned to the party best able to bear it. Financing sits last because senior debt is conditional on the customer, delivery and construction workstreams being resolved first.

CASH-FLOW WATERFALL

Order of priority, from contracted revenue down to distributions. Bar widths are illustrative of seniority, not amounts. A full waterfall also provides for tax, required maintenance and cash-trap conditions.

THE ARCHITECTURE

1. **Ring-fenced project company**
   Owns the solar and battery assets and isolates project risk, giving lenders defined security.
2. **Long-term PPA as the revenue anchor**
   Bankability turns on counterparty credit, volume, pricing, credit support and termination protection, with lender assignment and step-in rights.
3. **Shortfall expressly allocated**
   The contracts set how continuous demand is met when solar and storage fall short, and which party bears the volume and price exposure.
4. **Staged equity, conditional debt**
   Development equity may precede approvals; project debt is conditional on the PPA, permits, grid arrangements and technical diligence.
5. **Debt sized to downside cash flow**
   Senior debt is sized against base and downside cases, with covenant headroom, reserve funding and distribution controls.
6. **Conservative lender base case**
   Unapproved direct-PPA revenue is excluded; if grid delivery is unavailable, permitted on-site supply is assessed on its own economics.

WHAT THE STRUCTURING ADDRESSES

BANKABILITY IS CONDITIONAL

It rests on counterparty credit, the delivery route, contracted volume, price and termination terms, not the PPA alone.

POWER COVER IS EXPLICIT

How continuous demand is met when solar and storage fall short, and which party bears the exposure.

CAPITAL IS STAGED

Equity may precede approvals; debt is conditional on the contracts, permits, grid arrangements and diligence.

DELIVERY ROUTE CONFIRMED FIRST

The delivery route and its several approvals are settled before execution, not assumed.

THE CORE POINT

The initial constraint is not access to capital. It is establishing a bankable allocation of customer, delivery, construction and financing risk. Once those risks are aligned, the capital structure can be designed around contracted and downside-tested cash flows.

Illustrative structuring case, not a live or completed transaction. Thailand's Energy Regulatory Commission is developing direct-PPA and third-party-access arrangements, so the delivery route and its approvals must be confirmed before execution.
